# Send an application. *Get a decision back.*

This guide takes you through the real intake path: you email a patient-assistance packet, Verdikt reads it, decides against the program's own rules, writes the reply from a frozen template, and holds it until a person approves. Then the letter comes back to you.

YOUR EMAIL › INGEST › TRIAGE › DECIDE › DELIVER › HUMAN APPROVES › REPLY TO YOU

## What you *need*

- **Any email account** — Gmail, Outlook, a work address. The sender does not matter.
- The **PDFs** in this folder: `ASP-100` and `ASP-110`, plus a **scanned fax** for test 3.
- About **five minutes**. You can approve the case yourself, so nobody else needs to be online.

## Where to *send*

| FIELD | VALUE |
|---|---|
| From | **any address you control** |
| To | `quire.template.agent@gmail.com` |
| Subject | must contain `alderwood` and `[pap:…]` |

## Three tests, three *predictable* answers

The applicant in the sample packet is fictional: a household of two earning $60,000. The CardioVita program's rules cap household income at 400% of the 2026 federal poverty guideline — $86,560 for a household of two.

| # | SUBJECT TAG | ATTACH | EXPECTED | WHY |
|---|---|---|---|---|
| 1 | `[pap:cardiovita-pap-2026]` | both PDFs | APPROVE | $60,000 is under CardioVita's cap of $86,560 (400% of the 2026 federal poverty guideline) |
| 2 | `[pap:cardiovita-pap-2026]` | ASP-100 only | MISSING INFO | No income worksheet, so it asks for one instead of guessing a denial |
| 3 | `[pap:cardiovita-pap-2026]` | scanned fax only | MISSING INFO | A noisy 7-page fax with no household size: it asks for it, and lists every field the two vision models read differently |

**Start with test 2.** It shows the difference between "this application fails" and "I can't decide this yet" — a wrong answer versus an honest one.

# Compose the *email*

## 1 Open a new message from any account

Use whatever address you like. Routing is decided by the subject line, not by who sent it, and the decision letter is sent back to the address you used.

## 2 Address it

```
To: quire.template.agent@gmail.com
```

## 3 Paste the subject exactly

The subject carries two tags. `alderwood` chooses the pharmacy; `[pap:cardiovita-pap-2026]` sends it to the decision pipeline and names the program. Without the `[pap:…]` tag the email is treated as a template upload instead — the most common reason a test seems to do nothing.

```
Subject: [pap:cardiovita-pap-2026] Alderwood — enrollment for Maria Chen
```

## 4 Paste the body

The attachments drive the decision, not the body — but send what a real clinic would.

```
Hello,

Please find attached the completed patient assistance enrollment packet
for Maria L. Chen, referral ALD-26-207741.

Enclosed:
  - ASP-100 Patient Enrollment & Prescription Referral (2 pages)
  - ASP-110 Household Income Worksheet (1 page)

The patient is currently uninsured and is requesting assistance under the
CardioVita program. Please let me know if anything further is needed.

Thank you,
Bayview Cardiology Associates
```

## 5 Attach the packet and send

PDF **ASP-100-enrollment-maria-chen.pdf**
Enrollment & prescription referral · 2 pages

PDF **ASP-110-income-worksheet-maria-chen.pdf**
Household income worksheet · 1 page

Leave out ASP-110 for test 2. Both files are flat PDFs with no form fields, so Verdikt has to read them the way it would read a fax.

**Test 3:** attach only `scanned-fax-packet-marcus-delgado.pdf`, a noisy, low-quality fax scan (fictional data), with the subject `[pap:cardiovita-pap-2026] Alderwood — faxed enrollment for Marcus Delgado`.

# Wait for a *person*

### 6 Verdikt picks it up within a minute

The inbox is checked every 60 seconds. Once your email is in, the pipeline reads both documents, classifies the case, finds the program rules that apply and returns a verdict that cites the rule that decided it. Then it merges that verdict into the program's frozen, human-approved reply template — no language model writes the letter.

### 7 Nothing is sent until a reviewer approves — and you can be the reviewer

Every outcome — approve, deny or missing info — stops in a review queue. This gate is in code, not configuration, so it cannot be switched off by accident.

> **Approve it yourself.** At `verdikt.aismith.ai` click **Sign in as demo user**, open **HumanLoop**, then your case. Check each stage, the rule that fired and the rendered letter, and click **Approve & send reply**.

### 8 The decision letter arrives in your thread

After approval the letter is emailed back to the address you sent from, as a reply to your original message, with the rendered decision attached.

## If *nothing* happens

| SYMPTOM | LIKELY CAUSE | FIX |
|---|---|---|
| Treated as a template, not a case | `[pap:…]` missing from the subject | Paste the subject from step 3 exactly |
| Not routed to the pharmacy | `alderwood` missing from the subject | Keep the word in the subject |
| Rejected for no attachments | Files dropped, or over 20 MB | Attach the PDFs from this folder |
| Re-sent, nothing new | Forwarded or re-opened an old message | Send a fresh email |

Everything in the sample packet is fictional: the patient, prescriber, pharmacy, drug and programs. Addresses use the reserved `.example` domain and phone numbers use 555. Live demo: `https://verdikt.aismith.ai`
